

# Marketing site strategic analysis

An analysis of the marketing site's information architecture, intended audience, and competitive positioning.  
tradefundrr-main-site.vercel.app

## 1. Site flow at a glance

The marketing site is structured as a four-tier funnel. Traffic enters at the top from paid, search, brand or referral, and education sources. It gets oriented on the homepage, deep-dives on a product page that matches the visitor's asset class, and converts at the bottom into a funded-trading signup or a Pro Trader Funding inquiry. The diagram below traces the path and labels each tier by the audience awareness level it is built for.

### Marketing site information architecture

Traffic entry, routing, and the audience awareness level each page is built for.

The funnel is intentionally asymmetric. Each product page is built to do its own qualification work, but they all funnel into the same set of plan CTAs at the bottom. The Why-Us page exists as a separate URL whose entire purpose is the side-by-side comparison against other prop firms. The About page handles the trust narrative through Christian Bose and the T3 partnership.

## 2. What the flow is trying to accomplish

The site is a funnel with three nested asks, not a brochure. Each tier does one specific job.

### Tier 1 · Homepage: orientation and trust

Most prop firm shoppers do not know what funded trading is when they arrive from a cold ad. The homepage opens with a "What is funded trading?" orientation panel, follows with the Christian and T3 partnership trust block, then presents the First-Payout Rebate framing of the offer. By the time a visitor sees a price, they have already been positioned to trust the operation. The competitor comparison block on the same page gives the most-aware shopper an immediate head-to-head without having to leave.

### Tier 2 · Product pages: qualification

Stocks and options pages each take a self-identified day trader and walk them through 22 sections that end in a Growth, Express, or Pro Trader plan choice. Each page reframes the prospect's specific binding constraint: account size for stocks (\$25K retail caps make scaling impossible), contract count for options (retail margin treatment caps multi-leg setups). The Why-Us page does the explicit head-to-head against Topstep, Apex, Earn2Trade, FTMO, and Maverick Trading.

### Tier 3 · Conversion

The Growth and Express buttons are the primary money line. Pro Trader Funding sits to the side as a high-ticket alternate path for traders who arrive with capital of their own. The Funding Dashboard login is the actual hand-off into the product. The trust ticker, glossary, Trustpilot summary, and founder card all live on this tier as the final confidence layer before the signup click.

## 3. Audience awareness

The site is intentionally pitched to a hybrid audience, not a single Schwartz tier.

- **Primary target: mid-aware (problem to solution).** The avatar section, the math reframes ("20% return on \$25K is \$5,000; same return on \$100K is \$20,000. Same edge. Different scale."), and the Growth-vs-Express comparison all assume the reader is already a retail trader hitting a ceiling. They know they have a strategy. They do not yet know prop firms are the answer.
- **Secondary target: low-aware (unaware to problem).** The orientation panel, the "Where the payouts actually come from" econ section, the glossary, and the 3-step explainer are bolted on for visitors who arrive cold from a Meta ad without any prop firm context.
- **Tertiary target: most-aware (TradeFundrr vs Topstep vs Apex).** A solution-aware prop firm shopper is served by the competitor comparison section that lives on the homepage, stocks, options, why-us, and about pages. The table reads from each provider's public documentation and presents the head-to-head without forcing the visitor to leave the site.

## 4. Landscape fit

### 4.1 What is strong

- **T3 Trading Group / T3 Global partnership.** This is the single best differentiator in the category. Most of the prop firm landscape consists of unregulated foreign sim shops; many of the larger US firms (Topstep, Apex) do not advertise a regulated broker-dealer partner. The TradeFundrr offer is backed by a FINRA / SIPC-member broker-dealer and a real institutional desk. Few competitors can credibly say this.
- **Live-capital path scale.** TradeFundrr graduates top performers to \$1M+ buying power, scaling to \$20M+ at the top tier. Topstep caps at \$150K. Earn2Trade caps at \$400K. T3 Global is materially larger. Scale is the moat, not the existence of the path itself.
- **Asset class breadth.** Stocks, options, futures, and crypto on one program. Topstep, Apex, and Earn2Trade are futures-only. FTMO is forex and CFD. Few firms cover the breadth TradeFundrr does.
- **Legal posture on the rebate.** First-Payout Rebate framing with explicit non-guarantee language rather than "guaranteed payout." This is precisely the language MyForexFunds did not have when the CFTC came for them in 2023. A meaningful regulatory moat against being lumped in with the bad actors in the category.

### 4.2 What is exposed

- **Proof artifacts are thin.** The trust ticker uses abstractions ("Growing Community of Funded Traders") rather than real numbers. The Trustpilot summary cards exist but a live widget would carry more weight. A monthly paid-out total counter (which Apex publishes) would close the credibility gap with the most-aware shopper.
- **Futures and crypto pages are on the legacy visual system.** Futures has the largest TAM in the prop firm category. The futures page and the crypto page do not currently carry the new design system, the rebate framing, or the competitor comparison section. The visitor experience is inconsistent across asset classes.
- **Comparison data is point-in-time accurate.** Competitor cells in the head-to-head table are audited monthly via a scheduled task that flags drift, but between audits cells can go stale. The prop firm category changes pricing and rules frequently.

## 5. Recommended next priorities

In order of leverage:

- **1. Futures page rebuild.** Largest TAM in the category. Once on the current visual system with the rebate framing and competitor comparison embedded, the site becomes consistent across asset classes. This is the highest-impact remaining piece of work.
- **2. Crypto page rebuild.** Smaller TAM than futures but still meaningful coverage. Same template, smaller scope of work.
- **3. Proof layer hardening.** Replace the trust ticker abstractions with real numbers. Add a live Trustpilot widget. If aggregate payout data supports it, publish a monthly paid-out total. Each individual change is small; compounded, they meaningfully change how the most-aware shopper reads the site.

- **4. Mobile audit pass.** The competitor comparison table has horizontal-scroll behavior below 1100px. Worth a walk-through on a real device to confirm the swipe hint and scroll feel are right.
